

# Metro State of Safety Report

A compilation of information on roadway-related crashes, injuries, and fatalities  
in the greater Portland region and beyond, 2011-2015 crash data

January 2018

## Executive Summary

No death or life changing injury from a traffic crash is acceptable on our region's roadways, which is why Metro and regional partners are adopting a Vision Zero target for 2035 and implementing a safe systems approach to transportation safety.

The information in this State of Safety Report was used to inform the development of the 2018 Regional Transportation Safety Strategy and to develop performance measures to meet federal requirements required in the federal transportation bill MAP-21.

Between 2011 and 2015, there were 304 Fatal crashes in the Portland Metro region, killing 311 people, and an additional 2,102 crashes resulting in incapacitating injury. Nationwide, crashes killed an average of 33,305 people per year between 2011 and 2015, and roadway safety remains one of the most pressing health issues nationwide. The 8% increase in traffic deaths in 2015 is the highest increase in fifty years, and it is expected that the number of Serious crashes in 2016 and 2017 will be even higher. For young people between the ages of 5 and 24, motor vehicle crashes are the leading cause of death.

It is the Portland Metro region's adopted goal to progressively reduce the number of people killed or seriously injured on the region's roadways to zero by 2035. The purpose of this report is to document roadway crash data, patterns, and trends in the Portland Metro area and beyond to inform the pursuit of this goal. The Oregon Department of Transportation (ODOT) has assembled and distributed statewide crash data since 2007. This is a rich dataset, including numerous information fields for each geocoded crash, and is complemented by Metro's rich datasets of transportation infrastructure, transportation operations, and spatial data. The combination of these provides the opportunity of detailed analyses of the safety of the region's transportation system and land use patterns. Further, a large amount of US and international data is available to document national and international patterns and trends. This information is important to provide context for local data.

In 2010-2011, Metro staff worked with staff from cities and counties of the Metro region, ODOT, TriMet, and other local safety experts to develop a strategy for analyzing and summarizing this data from 2007 to 2009. The 2012 State of Safety report was the result of this collaboration. This report updates these findings, using the most recent five years of crash data – through 2015. It identifies trends and relationships of Serious crashes with environmental factors including roadway characteristics. This report provides the data for the update of the 2018 Regional Transportation Safety Action Plan.

The findings include:

- Nationally and in Oregon, fatalities have stabilized for automobile occupants and motorcyclists, while fatalities have been increasing for pedestrians and bicyclists. (*Section 1*)
- Higher levels of vehicle miles travelled (VMT) correlate with more Fatal and Serious crashes due to increased exposure. (*Section 1*)
- The Portland Metro region has less than half the annual fatalities per million residents compared to Oregon's and the national average. (*Section 1*)

- Arterial roadways comprise 73% of the region's Serious crashes, 77% of the Serious Pedestrian crashes, and 65% of the Serious Bicyclist crashes, while accounting for 12% of road miles. *(Sections 2, 5, and 6)*
- Alcohol or drugs were a factor in 57% of Fatal crashes. *(Section 2)*
- Excessive speed is a contributing factor in 33% of Fatal crashes, and aggressive driving is a factor in 34% of Fatal crashes. *(Section 2)*
- Seat belt use in the region as reported exceeds 99%. *(Section 2)*
- The percent of Serious crashes for male drivers age 70-79 and female drivers age 80-84 is double the regional average. *(Section 2)*
- Streets with more lanes have higher Serious crash rates per road mile and per VMT. This follows trends documented in AASHTO's Highway Safety Manual. *(Section 3)*
- Streets with more lanes have an especially high Serious crash rate for pedestrians, producing higher crash rates per mile and per VMT as compared to other modes. *(Section 5)*
- The most common Serious crash types were Turning and Rear End. For Fatal crashes, the most common types were Pedestrian and Fixed Object. *(Section 3)*
- Serious Pedestrian crashes are disproportionately represented after dark. While 39% of all Serious crashes happen at night, 64% of Serious Pedestrian crashes happen at night. *(Section 5)*

| Pedestrian Crashes.....                           | 71 |

## Introduction

It is the Portland Metro region's adopted goal to progressively reduce the number of people killed or seriously injured on the region's roadways to zero by 2035. Part of a safe systems approach to transportation safety is to use a 'data-driven' approach identify what causes crashes and strategies and actions to address those causes.

The purpose of this report is to document roadway crash data, patterns, and trends in the Portland Metro area and beyond to inform the pursuit of this goal. The Oregon Department of Transportation (ODOT) has assembled and distributed statewide crash data since 2007. This is a rich dataset, including numerous information fields for each geocoded crash, and is complemented by Metro's rich datasets of transportation infrastructure, transportation operations, and spatial data. The combination of these provides the opportunity of detailed analyses of the safety of the region's transportation system and land use patterns.

Further, a large amount of US and international data is available to document national and international patterns and trends. This information is important to provide context for local data.

## Methodology

In this report, crashes are broken down by a number of factors contained in the dataset provided by ODOT.

- Injury Type: Each crash is identified by the worst injury incurred in the crash: Fatal, Injury A (incapacitating), Injury B (moderate), Injury C (minor) or Property Damage Only (PDO). This report largely focuses on Fatal/Incapacitating crashes (the sum of Fatal and Injury A), referred to as 'Serious Crashes' throughout this report. These are the types of crashes that the region is primarily focused on eliminating.
- Location
- Date and Time
- Weather and Pavement Conditions
- Roadway Location: the location on the roadway system allows data from Metro's mapping databases to be attributed to the crash.
- Contributing Factors: These include speeding, alcohol, drugs, school zone, work zone, and hit and run.

ODOT's crash data is reliant on crash information collected by police. Quality of crash data is dependent upon thoroughness of information collected at the crash scene. ODOT checks the data for quality and geo-codes the data to the street network. This process results in Metro acquiring the crash data one to one and half years later.

Metro's mapping database includes:

- Roadway data, such as speed, geometry, traffic volumes, traffic congestion, transit routes, bicycle routes, and sidewalk inventory
- Spatial data, such as land use, population, density, socioeconomic factors, and walkability

Note that many figures in this document are in color, and while colors are generally selected to be legible when printed in black and white, they are most readable in full color.

## Definitions

Terms that are used throughout this report are defined as follows:

**“Portland Metro region”** is the scope of this study, and is defined as the area within the Metropolitan Planning Area (MPA) as of December 31, 2016. The MPA is slightly larger than the Urban Growth Boundary (UGB).

**“Serious Crashes”** in this report refers to the total number of Fatal and Injury A crashes. The words “Serious” and “Fatal” are capitalized throughout the report for emphasis.

**“Injury A”** and **“Incapacitating injury”** are used interchangeably. Incapacitating injuries typically are injuries that the victim is not able to walk away from. They are synonymous with the term **“Severe injury”**

**“Injury B”** and **“Moderate injury”** are used interchangeably.

**“Injury C”** and **“Minor injury”** are used interchangeably.

**Per capita** is used to describe crash rate per population. Except where otherwise noted, crash rates are per million residents.

**Per VMT** is used to describe crash rate per vehicle miles. Except where otherwise noted, crash rates are per 100-million vehicle miles travelled.

**Arterial** is a functional classification for surface streets. AASHTO defines arterials from the motor vehicle perspective as providing a high degree of mobility for the longer trip lengths and high volumes of traffic, ideally providing a high operating speed and level of service and avoiding penetrating identifiable neighborhoods.

**Collector** is a functional classification for surface streets. AASHTO defines collectors as providing both land access and traffic circulation within neighborhoods and commercial and industrial areas. The role of the collector system, from the motor vehicle perspective, is to distribute traffic to and from the arterial system.

**Local** is a functional classification for surface streets that includes all public surface streets not defined as arterial or collector. Local streets are typically low-speed streets with low traffic volumes in residential areas, but also include similar streets in commercial and industrial areas.

## Section 1 – Regional, State, National, and International Trends

Data from the National Highway Traffic Safety Administration (NHTSA) were compiled and analyzed along with population data from the US Census to identify trends in national, state, regional and city crashes. NHTSA summarizes traffic fatality data by state and by major city, including number of fatalities, fatalities per capita and per vehicle-miles travelled (VMT), and by travel mode. Five years of data between 2011 and 2015 were generally considered for this analysis, while longer term trends were identified where additional earlier years of data were available.

### *Travel and Fatality Patterns: US and Oregon*

Travel patterns in the US have changed in the last decade due to a variety of external factors. While the population has continued to increase, VMT per capita and absolute VMT have declined. Roadway fatality rates declined after 2005, but have increased significantly since 2010. In Oregon, these trends have been consistent with national patterns, although fatalities in Oregon increased more dramatically since 2013. This rapid increase does not appear to be a statistical outlier as the trend has continued in 2016 and 2017 (official data is not yet available for 2016-17). Figures 1-1 and 1-2 show the national and state trends of population, VMT, and crash-related fatalities.

Figure 1-1

Figure 1-2

It is common practice to normalize roadway fatality rates by both population and traffic volumes.

Normalization by population is useful in measuring the overall safety of the roadway system.

Normalization by traffic volumes is useful in measuring the safety per distance travelled. Figures 1-3 and 1-4 show national and state trends for fatalities and fatality rates.

Figure 1-3

Figure 1-4

Total fatalities, fatalities per capita, and fatalities per VMT are all generally decreasing over time, although there has been a notable uptick since 2010. The increases in Oregon since 2013 are more pronounced than national trends.

### ***Fatality Patterns by Mode: US and Oregon***

The NHTSA data are broken out by mode: automobile occupants, motorcyclists, bicyclists, and pedestrians. Figures 1-5 and 1-6 show the recent national and state trends for each mode.

Figure 1-5

Figure 1-6

Fatalities have recently stabilized nationally for automobile occupants and motorcyclists, while fatalities have been increasing nationally for pedestrians and bicyclists. The decrease in fatalities for people in automobiles is likely due to advancements in vehicle technology, such as air bags.

## Annual Vehicle-Miles Traveled (VMT)

One of the clearest trends in crash data nationally and locally, is the correlation between fatality rates and annual per capita VMT. Figure 1-7 shows the relationship by US state for all fatalities, and Figure 1-8 shows the relationship for pedestrian or bicyclist fatalities.

States with higher per capita VMT typically also have higher per capita fatality rates, as the typical exposure to risk is increased. A polynomial equation with a good R-squared value can be fitted to the relationship between roadway fatalities and VMT, and is shown in Figure 1-7.

### All Fatalities

It is apparent from the data that states with more auto travel typically exhibit higher fatality rates. The District of Columbia has the lowest per capita VMT at 5,480, and exhibits the lowest annual fatality rate of 33 per million residents – less than one-third of the national average. Of the states, Massachusetts has the lowest fatality rate, with the 7<sup>th</sup> lowest per capita VMT. Wyoming, with the highest per capita VMT of 16,200, also has the highest annual fatality rate at 221 per million residents – more than double the national average.

Figure 1-7

As with the 2012 State of Safety report, which looked at 2005 – 2009 data, a polynomial equation with a good R-squared value can be generated for the VMT-fatality relationship by setting the intercept to zero. While the equation is likely to vary slightly year-to-year, the relationship appears to be permanent. The relationship for 2011 – 2015 data is shown in Figure 1-7.

The national average is 9,500 VMT per capita and 105 fatalities per million residents.

Oregon statistics are 8,680 VMT per capita (91% of the national average) and 90 fatalities per million residents (86% of the national average).

### Pedestrian/Bicyclist Fatalities

The relationship between statewide VMT per capita and pedestrian/bicyclist fatalities is unclear. As can be seen in Figure 1-8, the data are scattered, and unlike the overall fatality data, no clear trend exists. This may be due to the complex relationships at play – higher VMTs can make pedestrian/bicyclist travel more dangerous, but discourage travel by these modes thereby reducing pedestrian/bicyclist exposure.

The national average (2011 – 2015) is 15.3 pedestrians killed in crashes per million residents and 2.3 bicyclists killed in crashes per million residents.

Oregon crash statistics are 14.0 pedestrians killed per million residents (91% of the national average) and 2.2 cyclists killed per million residents (94% of the national average).

Figure 1-8

## State-by-State Fatality Trends

Figure 1-9 shows the per capita fatality rate by state. Oregon is slightly better than the US average.

Figure 1-9

## European Data

Data from the EU Road Federation's publication "European Road Statistics" were compiled in order to provide a comparison to US data. European practices are often considered as a best practice as their transportation systems are generally safer and more efficient than US systems.

Figures 1-10 and 1-11 present European roadway fatality rates per capita and per VMT.

Of the 28 EU countries, 22 of them exhibit lower rates of roadway fatality per capita than the US average. On a per-VMT basis, 19 of them exhibit lower fatality rates than the US average.

Figure 1-10

Figure 1-11

European countries appear to be limiting roadway fatalities both by managing safer roadways and developing transportation systems and development patterns which require less driving.

## Urban Region Fatality Trends

Crash and population data was reviewed for the urban regions in the US (using Metropolitan Planning Organization boundaries), using FHWA's Roadway Safety Data Dashboards. A comparison was made of the large urban regions – those with populations of over 1 million people as of the 2010 Census. Figure 1-12 shows the per capita fatality rate by urbanized region. Note that the rate is slightly overstated since it is based on fatal crashes between 2011 and 2015 compared to a 2010 population due to the limited availability of regional population data. Roadway fatalities per capita in the Portland Metro region are less than 40% of the US average and less than half the State of Oregon's average.

Figure 1-12

## Fatality rates

The worst regions in the nation for overall fatality rates are concentrated in Florida and the Sun Belt, where driving is the completely dominant mode of travel. The safest regions in the nation for overall fatality rates are Boston, Minneapolis-St. Paul, Portland, New York, and Chicago. In general, the safest urban regions are those that exhibit dense urban environments and higher usage of non-auto travel modes.

## US City Data

NHTSA data include counts of all fatalities and pedestrian fatalities in US cities. This information is of special interest for this report given that the the Portland Metro region is highly urbanized and that the adopted growth concepts call for accomodating growth by increasing urbanization.

The figures below summarize overall fatality rates and pedestrian fatality rates for the best and worst 15 cities with population above 300,000. The figures are five-year averages (2011 – 2015). Asterisks (\*) indicate that the city was also in the best or worst 15 for the 2012 State of Safety report, which looked at 2005 – 2009 data. There is a high degree of consistency between the best and worst cities between the two reports despite the differing analysis periods, indicating an established long-term relationship.

### Overall fatality rates

The worst cities in the nation for overall fatality rates are Detroit, St. Louis, Memphis, Jacksonville, and Kansas City MO. In general, the worst cities are in states which have higher levels of VMT per capita, such as Michigan, Missouri, Florida, Texas, Oklahoma, and Arizona.

The safest cities in the nation in terms of roadway fatalities per capita are Boston, New York, Washington DC, Minneapolis, and Seattle. In general, the safest cities are those that exhibit dense urban environments and higher usage of non-auto travel modes.

As of 2014, the city of Portland ranks well in this list, at 13<sup>th</sup> best out of the 65 cities of population 300,000 or more. In the prior State of Safety report, Portland ranked 8<sup>th</sup> best.

Figure 1-17

### Pedestrian fatality rates

The worst cities in the nation for pedestrian crash fatality rates are Detroit, Miami, St. Louis, Jacksonville, and Phoenix. Many of the most dangerous cities for pedestrians are in states which have higher levels of VMT per capita.

The safest cities in the nation for pedestrians per capita in terms of crash fatalities are Virginia Beach, Boston, Wichita, Seattle, and Cleveland. The city of Portland ranks in the middle of the pack, at 43<sup>rd</sup> of the 65 cities of population 300,000 or more.

Figure 1-18

## Discussion

In general, overall fatality rates per capita in cities are less than the national average for all areas. For example, the city of Portland's average annual fatality rate of 52 fatalities per million residents is much less than the national average of 105 and the Oregon statewide average of 90. Fifteen of the 65 cities exhibited crash fatality rates above the overall national average, with 50 exhibiting crash fatality rates below the national average.

This is likely due to a number of factors including fewer miles driven per capita due to the proximity of services, and the lower speeds of urban streets compared to rural highways, resulting in lower crash severity.

In general, cities which are more urban and which have lower levels of VMT per capita show substantially lower overall crash fatality rates. Those which have invested disproportionately in auto infrastructure, and therefore have higher VMT per capita, exhibit higher crash fatality rates.

Regarding pedestrian fatality rates, the relationships are complex, as cities with better pedestrian infrastructure encourage use by people walking, thereby increasing exposure. So while it may be safer to walk a given distance, the increased walking that results may increase pedestrian exposure and thus pedestrian crashes. Increasing walking may lead to more pedestrian fatalities because of the increased exposure but fewer overall fatalities because of the reduced VMT.

Cities which have managed to consistently demonstrate both low overall fatality rates and low pedestrian fatality rates include Boston, Seattle, Virginia Beach, and Minneapolis.

## Section 2 – All Crashes

This section summarizes all crashes occurring in the Portland Metro region. The term “Serious crashes” refers to all Fatal or incapacitating injury (Injury A) crashes.

### Crashes By Year

| Year         | Total Crashes  | Fatal Crashes (Fatalities) | Injury A Crashes | Injury B Crashes | Injury C Crashes | All Injury Crashes (Injuries) | Serious Crashes |
|--------------|----------------|----------------------------|------------------|------------------|------------------|-------------------------------|-----------------|
| 2011         | 22,591         | 54 (54)                    | 455              | 2,487            | 8,404            | 11,400                        | 509             |
| 2012         | 23,064         | 63 (66)                    | 421              | 2,654            | 8,555            | 11,693                        | 484             |
| 2013         | 22,736         | 66 (68)                    | 363              | 2,428            | 7,666            | 10,523                        | 429             |

| <b>METRO</b> | <b>116,398</b> | <b>304 (311)</b>           | <b>2,102</b>     | <b>12,736</b>    | <b>42,723</b>    | <b>57,865 (81,718)</b>        | <b>2,406</b>    |

Figures 2-1 and 2-2

Total reported crashes and injury crashes have increased since 2007 (Figure 2-1). Fatal and Serious crashes have fluctuated since 2007, but have more recently been increasing (Figure 2-2). Data prior to 2011 is included where available.

\* All data for other regions and cities is 2010 - 2014

\*\* All data for UK and EU is for year 2013

The City of Portland, the Portland Metro region, and the State of Oregon all have fatality rates below the national average. The fatality rates in the State of Oregon when the Metro region is excluded from consideration are higher than the national average. The United Kingdom and European Union data are included for reference as international best practice.

| <b>METRO</b>                  | <b>1,603,229</b>     | <b>10,437,000,000</b> | <b>7,219</b>          | <b>111</b>      | <b>300</b>             | <b>4.6</b>      |

With the highest population and VMT, Portland has the largest share of the region's Serious crashes (Figure 2-3). Portland has the highest rate of Serious crashes per capita, while Multnomah (excludes Portland) has the highest rate of Serious crashes per VMT. Clackamas County has the lowest rate of Serious crashes per capita and per VMT.

These two tables and the accompanying Figure 2-5 summarize crash data within the region by City and for the unincorporated sections of each of the three counties. Crash rates were determined per capita but not per VMT, as the VMT estimates for the smaller cities are not considered reliable enough for such an analysis.

| City           | Population<br>(2015) | 2011-2015 Annual crashes       |                             |

\* VMT for local streets is a low-confidence estimate

Figures 2-8 and 2-9

A review of the distribution of the region's Serious crashes by roadway classification reveals one of the most conclusive relationships in this study. Arterial roadways are the location of the majority of the Serious crashes in the region (Figure 2-8). A similar relationship is evident for pedestrians and cyclists, as detailed in Sections 5 and 6. Freeways and their ramps are relatively safe, per mile travelled, compared to arterial and collector roadways (Figure 2-9).

Figure 2-10 presents the functional classification of the region's roadways. Blue are freeways, red are arterial roadways, green are collectors roadways, and light blue are local.

Figure 2-10

| 9 PM                                                                                               | 2.6  | 3.2  | 2.4  | 3.6  | 3.8  | 3.6  | 1.8  |  | 9 PM    | 3.3       | 2.2       |
| 10 PM                                                                                              | 1.8  | 2.0  | 1.8  | 2.8  | 2.6  | 3.0  | 3.4  |  | 10 PM   | 2.4       | 2.6       |
| 11 PM                                                                                              | 1.4  | 1.2  | 1.4  | 2.0  | 1.6  | 2.8  | 1.8  |  | 11 PM   | 1.8       | 1.6       |
|                                                                                                    |      |      |      |      |      |      |      |  |         |           |           |
|                                                                                                    | Sun  | Mon  | Tue  | Wed  | Thu  | Fri  | Sat  |  |         | Avg Wkday | Avg Wkend |
| All Day                                                                                            | 59.6 | 62.8 | 67.6 | 73.0 | 71.8 | 78.4 | 66.4 |  | All Day | 70.7      | 63.0      |

Figure 2-15 presents the rate of Serious crashes by day of the week and hour of the day using a “heat map” format. Dark cells indicate the highest relative crash time periods; light cells indicate the lowest relative crash time periods. The average weekday and weekend day are summarized on the right side of the figure, while each day is summarized and compared at the bottom of the figure.

The weekday evening peak hours produce the highest number of Serious crashes, with the 5:00 – 5:59 pm hour as the worst. Late Friday night/early Saturday morning and late Saturday night/early Sunday morning also stand out with high rates of Serious crashes.

## By Weather

| Weather      | 2011-2015 Annual Crashes |            |
|--------------|--------------------------|------------|
|              | All                      | Serious    |
| Cloudy/Clear | 17,658                   | 384        |
| Rain/Fog     | 4,462                    | 84         |
| Sleet/Snow   | 189                      | 3          |
| Unknown      | 970                      | 10         |
| <b>METRO</b> | <b>20,947</b>            | <b>481</b> |

The majority (80%) of Serious crashes occurred in clear or cloudy conditions (Figure 2-16).

Figure 2-16

## By Road Surface Condition

| Road Condition | 2011-2015 Annual Crashes |            |
|----------------|--------------------------|------------|
|                | All                      | Serious    |
| Dry            | 16,378                   | 349        |
| Ice/Snow       | 342                      | 6          |
| Wet            | 5,715                    | 120        |
| Unknown        | 844                      | 6          |
| <b>METRO</b>   | <b>20,947</b>            | <b>481</b> |

The majority (73%) of Serious crashes occurred in dry conditions (Figure 2-17).

Figures 2-19 and 2-20

Figures 2-19 and 2-20 present Serious crash types and Fatal crash types. Fatal crashes are specifically broken out here because the distribution is substantially different. For the purpose of establishing crash type, bicycles are considered vehicles, and so there is no separate bicycle crash type.

The most common Serious crash types were Turning and Rear End.

The most common Fatal crash types were Pedestrian and Fixed Object.

Figures 2-21 and 2-22

Figure 2-21 presents the the percentage of crashes of Serious severity (Fatal or Injury A) with each contributing factor. Figure 2-22 presents the the percentage of Fatal crashes with each contributing factor. Each crash may have several contributing factors. The determination of contributing factors is described in more detail in Section 7.

Alcohol and Drugs, Excessive Speed, Fail to Yield ROW, and Aggressive Driving are particularly common factors. Crashes involving Alcohol and Drugs have a much higher likelihood of being Fatal than other crashes.

## By Driver's Age and Gender

The age and gender of drivers involved in crashes, regardless of fault, are presented in the following table and Figures 2-23 and 2-24.

| Age Group    | Total Male Drivers (2011 – 2015) |              |                 | Total Female Drivers (2011 – 2015) |            |                 |
|--------------|----------------------------------|--------------|-----------------|------------------------------------|------------|-----------------|
|              | All Crashes                      | Serious      | Percent Serious | All Crashes                        | Serious    | Percent Serious |
| 14-17        | 3,076                            | 17           | 0.6%            | 3,579                              | 42         | 1.2%            |

| Males                                                   | 80,645         | 690          | 47,065        | 99.2%           | 0.8%           |
| Females                                                 | 80,086         | 394          | 34,113        | 99.5%           | 0.5%           |
| Unknown                                                 | 245            | 2            | 6,261         | 99.2%           | 0.8%           |
| <b>METRO</b>                                            | <b>160,976</b> | <b>1,086</b> | <b>87,439</b> | <b>99.3%</b>    | <b>0.7%</b>    |

Seat belt use in the region as reported exceeds 99%.

Males were 71% more likely than females to be reported without a seat belt.

**Occupants without seat belts were 12 times as likely to be seriously injured or killed as occupants wearing seat belts.**

## Section 3 – Roadway Characteristics of Non-Freeway Crashes

### By Roadway Classification

| Roadway Classification | Total Road-Miles | Annual VMT (2015)    | 2011-2015 Annual Crashes |              |            |
|------------------------|------------------|----------------------|--------------------------|--------------|------------|
|                        |                  |                      | All                      | All Injury   | Serious    |
| Arterial               | 772              | 4,281,000,000        | 14,463                   | 7,529        | 318        |
| Collector              | 994              | 1,081,000,000        | 3,609                    | 1,705        | 89         |
| Local                  | 4,565            | 620,000,000*         | 1,519                    | 536          | 27         |
| <b>METRO</b>           | <b>6,331</b>     | <b>5,982,000,000</b> | <b>19,591</b>            | <b>9,771</b> | <b>434</b> |

\* VMT for local streets is a low-confidence estimate

Figures 3-1 and 3-2

| Roadway Classification | % crashes resulting in |             | Annual Crashes per Road-Mile |           | Annual Crashes per 100M VMT |           |

| Local                  | 35%                    | 1.8%        | 0.1                          | 0.01      | --                          | --        |
| <b>METRO</b>           | <b>50%</b>             | <b>2.2%</b> | <b>--</b>                    | <b>--</b> | <b>--</b>                   | <b>--</b> |

A review of the distribution of non-freeway Serious crashes by roadway classification reveals one of the most conclusive relationships in this report. Arterial roadways are the location of the majority of the Serious crashes in the region. Despite making up only 12% of the region's non-freeway road miles, they constitute 73% of the Serious crashes (Figures 3-1 and 3-2). A similar relationship is evident for pedestrians and cyclists, as detailed in Sections 5 and 6. In general, these roads have high traffic volumes, high travel speeds, and are challenging to pedestrians crossing.

As shown in Figure 3-3, collector streets have the highest crash rate per traffic volume, followed closely by arterial streets. Figure 3-4 presents the functional classification of the region's roadways. Red are arterial roadways and green are collector roadways.

Figure 3-3

Figure 3-4

Map of Roadway Functional Classifications

## By Number of Lanes

The following tables and Figures 3-5 and 3-6 summarize crashes by number of lanes for arterial and collector roadways.

| Number of Arterial/Collector Lanes | Total Road-Miles | Annual VMT (2015) | 2011-2015 Annual Crashes |            |         |
|------------------------------------|------------------|-------------------|--------------------------|------------|---------|
|                                    |                  |                   | All                      | All Injury | Serious |
| 1 – 3 Lanes                        | 1,427            | 2,972,000,000     | 8,932                    | 4,217      | 198     |
| 4+ Lanes                           | 340              | 2,738,000,000     | 10,597                   | 5,532      | 236     |

Figures 3-5 and 3-6

| Number of Arterial/Collector lanes  | % crashes resulting in |             | Annual Crashes per Road-Mile |             | Annual Crashes per 100M VMT |            |
|-------------------------------------|------------------------|-------------|------------------------------|-------------|-----------------------------|------------|
|                                     | All Injury             | Serious     | All Injury                   | Serious     | All Injury                  | Serious    |
| 1-3 lanes                           | 47%                    | 2.2%        | 3.0                          | 0.14        | 142                         | 6.6        |
| 4+ lanes                            | 52%                    | 2.2%        | 16.3                         | 0.69        | 202                         | 8.6        |
| <b>ALL ARTERIALS AND COLLECTORS</b> | <b>50%</b>             | <b>2.2%</b> | <b>5.5</b>                   | <b>0.25</b> | <b>171</b>                  | <b>7.6</b> |

Figure 3-7

Figure 3-7 presents the crash rate per traffic volume, and Figure 3-8 presents the number of lanes for arterials and collectors in the region. The influence of street width is consistent with the influence of roadway classification. Wider roadways are the location of a disproportionate number of Serious crashes in relation to both their share of the overall system (Figures 3-5 and 3-6) and the vehicle-miles travelled they serve (Figure 3-7). Similar patterns are documented in AASHTO's Highway Safety Manual (2010), Chapter 12.

Figure 3-8 Map of Number of Lanes for Arterials and Collectors

***By Crash Type***

| Collision Type | 2011-2015 Annual Crashes |             |            |              |              |              |            |
|----------------|--------------------------|-------------|------------|--------------|--------------|--------------|------------|
|                | All                      | Fatal       | Injury A   | Injury B     | Injury C     | All Injury   | Serious    |

| Turning        | 5,108                    | 5.6         | 108        | 754          | 1,623        | 2,490        | 113        |
| <b>METRO</b>   | <b>19,591</b>            | <b>56.4</b> | <b>377</b> | <b>2,247</b> | <b>7,090</b> | <b>9,771</b> | <b>434</b> |

Figure 3-9 and 3-10

Figures 3-9 and 3-10 present non-freeway Serious crash types and non-freeway Fatal crash types. Fatal crashes are specifically broken out here because the distribution is substantially different. For the purpose of establishing crash type, bicycles are considered vehicles, and so there is no separate bicycle crash type.

The most common Serious crash types were Turning and Rear End.

The most common Fatal crash types were Pedestrian and Fixed Object.

***By Contributing Factor***

| Collision Type       | 2011-2015 Annual Crashes (Non-Freeway) |             |            |              |              |              |            |

Figures 3-11 and 3-12

Figures 3-11 and 3-12 present the proportion of non-freeway crashes by contributing factor for Serious and Fatal crashes, respectively. Alcohol or Drugs, Fail to Yield ROW, Aggressive Driving, and Excessive Speed are the most common factors.

The determination of contributing factors is described in more detail in Section 7.

## By Volume-to-Capacity Ratio

The combination of traffic data available from the region's travel demand model and crash data allowed for a comparison of traffic congestion with safety.

An analysis of Serious crash rates compared to congestion levels for non-freeway roadways was performed. The analysis included all roadways in the regional travel demand model, including all arterials and collectors, as well as certain local streets serving a collector function. The intent was to establish the relationship between congestion and safety.

PM peak 3-hour Volume-to-Capacity ratios as determined by the travel demand model were compared to the same 3-hours of weekday crash data. The results are shown in the table and Figures 3-13. Figure 3-14 presents the Volume-to-Capacity ratios for the region's non-freeway roadways.

| PM Peak V/C Range | Total Road-Miles | Annual PM Peak VMT (2015) | 2011-2015 Annual PM Peak Crashes (Non-Freeway) |         |               |         |              |         |
|-------------------|------------------|---------------------------|------------------------------------------------|---------|---------------|---------|--------------|---------|
|                   |                  |                           | Number of Crashes                              |         | Per Road-Mile |         | Per 100M VMT |         |
|                   |                  |                           | All Injury                                     | Serious | All Injury    | Serious | All Injury   | Serious |
| < 0.80            | 1,496            | 1,057,000,000             | 1,720                                          | 54      | 1.1           | 0.04    | 163          | 5.1     |
| 0.80 - 0.89       | 84               | 110,00,000                | 278                                            | 9       | 3.3           | 0.11    | 254          | 8.2     |
| 0.90 – 0.99       | 30               | 40,000,000                | 124                                            | 3       | 4.1           | 0.11    | 311          | 8.5     |
| ≥ 1.00            | 25               | 29,000,000                | 99                                             | 2       | 3.9           | 0.09    | 336          | 8.2     |

Figures 3-13 and 3-14

Map of V/C Ratios for Non-Freeway Roadways

The Serious crash rate per vehicle-mile travelled on arterials and collectors was highest with congestion.

The relationship is quite different from the analysis of 2007 – 2009 data, perhaps because of differences in travel demand model assignment procedures used and resulting Volume-to-Capacity ratio estimates. In order to provide a more conclusive analysis of this relationship, use of a more accurate tool for measuring real-world congestion, such as probe data, would be recommended.

## Section 4 – Roadway Characteristics of Freeway Crashes

### *By Number of Lanes*

| Number of Freeway lanes (in one direction) | Total Road-Miles | Annual VMT (2015)    | 2011-2015 Annual Crashes |              |           |
|--------------------------------------------|------------------|----------------------|--------------------------|--------------|-----------|
|                                            |                  |                      | All                      | All Injury   | Serious   |
| Freeway ramp                               | 83               | 275,000,000          | 300                      | 151          | 5         |
| 1 Lanes                                    | 10               | 48,000,000           | 68                       | 33           | 1         |
| 2 Lanes                                    | 61               | 758,000,000          | 493                      | 234          | 6         |
| 3 Lanes                                    | 111              | 2,386,000,000        | 1,906                    | 923          | 23        |
| 4+ Lanes                                   | 40               | 979,000,000          | 909                      | 456          | 12        |

| <b>ALL FREEWAYS</b>                        | <b>49%</b>             | <b>1.3%</b> | <b>5.9</b>    | <b>0.16</b> | <b>41</b>    | <b>1.1</b> |

The influence of freeway width is not as pronounced as for non-freeway roadways. Freeways with two directional lanes (including auxiliary lanes) exhibit the lowest crash rates, while the rate increases for freeways with more or fewer lanes (Figure 4-3). Figure 4-4 presents the number of lanes for the region's freeways. Ramps (off-ramps and on-ramps) exhibit a higher Serious crash rate per mile travelled, while still representing a relatively small proportion (11%) of all Serious freeway crashes (Figure 4-1). Single-lane segments are uninterrupted ramps connecting freeways.

Figure 4-5 and 4-6

Figures 4-5 and 4-6 present freeway Serious crash types and freeway Fatal crash types. Fatal crashes are specifically broken out here because the distribution is substantially different.

The most common Serious crash type was Rear End crashes.

The most common Fatal crash type was Fixed Object crashes.

Figures 4-7 and 4-8

Figures 4-7 and 4-8 present the proportion of freeway crashes by contributing factor for Serious and Fatal crashes, respectively. Alcohol and Drugs, Aggressive Driving and Excessive Speed are the most common factors.

The determination of contributing factors is described in more detail in Section 7.

## By Volume-to-Capacity Ratio

The combination of traffic data available from the region's travel demand model and crash data allowed for a comparison of traffic congestion with safety.

An analysis of Serious crash rates compared to congestion levels for freeways was performed. The intent was to establish the relationship between congestion and safety.

PM peak 3-hour Volume-to-Capacity ratios as determined by the travel demand model were compared to the same 3-hours of weekday crash data. The results are shown in the table and Figures 4-9. Figure 4-10 presents the Volume-to-Capacity ratios for the region's freeways, including ramps.

| PM Peak<br>V/C Range | Total<br>Road-<br>Miles | Annual<br>PM Peak<br>VMT (2015) | 2011-2015 Annual PM Peak Crashes (Freeway) |         |               |         |              |         |
|----------------------|-------------------------|---------------------------------|--------------------------------------------|---------|---------------|---------|--------------|---------|
|                      |                         |                                 | Number of Crashes                          |         | Per Road-Mile |         | Per 100M VMT |         |
|                      |                         |                                 | All Injury                                 | Serious | All Injury    | Serious | All Injury   | Serious |
| < 0.80               | 212                     | 537,000,000                     | 198                                        | 5.0     | 0.9           | 0.02    | 37           | 0.9     |

Figures 4-9 and 4-10

Map of V/C Ratios for Freeways

The Serious crash rate per vehicle-mile travelled on freeways increased with moderate congestion, but dropped and was lowest with severe congestion.

The relationship is consistent with the analysis of 2007 – 2009 data, and may result from traffic at free-flow speed encountering traffic stopped or slowed for congestion. In order to provide a more conclusive analysis of this relationship, use of a more accurate tool for measuring real-world congestion, such as probe data, would be recommended.

## Section 5 – Pedestrians (Non-Freeway Crashes)

### *By Year*

| Year         | Fatal Crashes (Fatalities) | Injury A Crashes | Injury B Crashes | Injury C Crashes | All Injury Crashes | Serious    |
|--------------|----------------------------|------------------|------------------|------------------|--------------------|------------|

| 2015         | 25 (25)                    | 55               | 196              | 190              | 466                | 80         |
| <b>METRO</b> | <b>105 (106)</b>           | <b>269</b>       | <b>1,090</b>     | <b>821</b>       | <b>2,285</b>       | <b>374</b> |

Figure 5-1

As presented in Figure 5-1, Serious and Fatal Pedestrian crashes increased somewhat over the 5-year period. Pedestrian fatalities have steadily increased to 2015.

Figure 5-2

With the highest population, transit usage, VMT, and likely the largest number of pedestrians, Portland has 51% of the region's Serious Pedestrian crashes (Figure 5-2). Portland also has the highest rate of Serious Pedestrian crashes per capita and per VMT. Multnomah (excludes Portland) also has high rates of Serious Pedestrian crashes per capita and per VMT. Clackamas County and Washington County have relatively low rates of Serious Pedestrian crashes, which is likely largely due to fewer people walking.

While Portland has the largest number and rate of Serious Pedestrian crashes, it is apparent from Figure 5-3 that there are a number of other cities and areas with a high rate of Serious Pedestrian crashes per capita. Gladstone, Gresham, Tigard, unincorporated Clackamas County, Forest Grove, Hillsboro, Beaverton, and Oregon City all experience relatively high rates of Serious Pedestrian crashes.

|                                                             | Sun | Mon | Tue  | Wed | Thu  | Fri  | Sat  |       |         | Average Wkday | Average Wkend |
| All Day                                                     | 8.6 | 9.2 | 10.6 | 9.6 | 12.4 | 12.6 | 11.4 |       | All Day | 10.9          | 10.0          |

Figure 5-5 presents the rate of Serious Pedestrian crashes by day of the week and hour of the day using a “heat map” format. Dark cells indicate the highest relative crash time periods; light cells indicate the lowest relative crash time periods. The average weekday and weekend day are summarized on the right side of the figure, while each day is summarized and compared at the bottom of the figure.

The weekday late afternoon and evening peak hours produce the highest number of Serious Pedestrian crashes. A larger proportion of evening crashes are evident as compared to all crashes. Late Friday night/early Saturday morning and late Saturday night show somewhat high rates of Serious Pedestrian crashes. Thursday, Friday, and Saturday have the highest rates of Serious Pedestrian crashes, predominantly evening crashes.

### By Weather

| 2011-2015 Annual Pedestrian Crashes |                 |
|-------------------------------------|-----------------|
| Weather                             | Serious Crashes |
| Cloudy/Clear                        | 53.6            |
| Rain/Fog                            | 19.6            |
| Sleet/Snow                          | 0.2             |
| Unknown                             | 1.4             |
| <b>METRO</b>                        | <b>74.8</b>     |

The majority (72%) of Serious Pedestrian crashes occurred in clear or cloudy conditions (Figure 5-6), as compared to 80% for all crashes (Figure 2-16).

Figure 5-6

### By Road Surface Condition

| 2011-2015 Annual Pedestrian Crashes |                 |
|-------------------------------------|-----------------|
| Road Condition                      | Serious Crashes |
| Dry                                 | 48.4            |
| Ice/Snow                            | 0.4             |
| Wet                                 | 25.0            |
| Unknown                             | 1.0             |
| <b>METRO</b>                        | <b>74.8</b>     |

The majority (65%) of Serious Pedestrian crashes occurred in dry conditions (Figure 5-7), as compared to 73% for all crashes (Figure 2-17).

Figure 5-7

### By Lighting

| 2011-2015 Annual Pedestrian Crashes |                 |
|-------------------------------------|-----------------|
| Lighting                            | Serious Crashes |
| Daylight                            | 27.2            |
| Dawn/Dusk                           | 8.4             |
| Night - Dark                        | 9.6             |
| Night - Lit                         | 29.6            |
| Unknown                             | 0.0             |
| <b>METRO</b>                        | <b>74.8</b>     |

Only 36% of Serious Pedestrian crashes occurred in daylight (Figure 5-8), as compared to 59% for all crashes (Figure 2-18). **Serious Pedestrian crashes are significantly more likely after dark as compared to other modes.**

Figure 5-8

## By Roadway Classification

| Roadway Classification | Total Road-Miles | Annual VMT (2015)    | 2011-2015 Annual Pedestrian Crashes |                       |                      |
|------------------------|------------------|----------------------|-------------------------------------|-----------------------|----------------------|
|                        |                  |                      | Serious                             | Serious per Road-Mile | Serious per 100M VMT |

\* VMT for local streets is a low-confidence estimate

Figures 5-9 and 5-10

As with overall crashes, the region's Serious Pedestrian crashes occur primarily on the arterials, accounting for 77% of these crashes. Figure 5-9 presents the distribution of Serious Pedestrian crashes by roadway classification. As can be seen in Figure 5-10, which presents the rate of Serious Pedestrian crashes per mile of roadway, arterial roadways are about 6 times as likely as collectors per mile to be the location of a Serious Pedestrian crash, and more than 65 times as likely as local streets per mile to be the location of a Serious Pedestrian crash.

Figure 5-11

As can be seen in Figure 5-11, when normalized by motor vehicle traffic volume, the Serious Pedestrian crash rate on arterials is still higher than on collectors. A reliable estimate of vehicle miles travelled was not available for local streets.

Many transit routes follow arterial roadways, increasing the need for people to cross these roadways safely.

## By Number of Lanes

| Number of Lanes* | Total Road-Miles | 2011-2015 Annual Pedestrian Crashes |                       |                      |
|------------------|------------------|-------------------------------------|-----------------------|----------------------|
|                  |                  | Serious                             | Serious per Road-Mile | Serious per 100M VMT |
| 1 – 3 Lanes      | 1,427            | 27.0                                | 0.019                 | 0.91                 |
| 4+ Lanes         | 340              | 47.4                                | 0.140                 | 1.73                 |
| <b>METRO</b>     | <b>1,766</b>     | <b>74.4</b>                         | <b>0.042</b>          | <b>1.31</b>          |

\* Arterial and Collector roadways only

Figures 5-12 and 5-13

The influence of street width is consistent with the influence of roadway classification (Figure 5-12). Wider roadways are the location of a disproportionate number of Serious Pedestrian crashes in relation to both their share of the overall system (Figure 5-13) and the vehicle-miles travelled they serve (Figure 5-14). The Serious Pedestrian crash rate increases dramatically for roadways with 4 or more lanes. This effect is in spite of the fact that such arterials often discourage pedestrian travel in the first place, thereby reducing potential pedestrian exposure.

As can be seen in Figure 5-14, even when normalized by motor vehicle traffic volume, the Serious Pedestrian crash rate on wider roadways is still substantially higher than on narrower roads. Wider roadways are particularly hazardous to pedestrians.

Many transit routes follow wider roadways, increasing the need for people to cross these roadways safely.

Figure 5-14

Figures 5-15 and 5-16

Figures 5-15 and 5-16 present the proportion of Pedestrian crashes by contributing factor for Serious and Fatal crashes, respectively. Alcohol or Drugs and Fail to Yield ROW are the most common factors. The determination of contributing factors is described in more detail in Section 7.

These data do not specify whether the driver, the pedestrian, or both were at fault, but fault in Pedestrian crashes is explored in more detail in Section 7.

### By Pedestrian's Age and Gender

The age and gender of pedestrians involved in crashes are presented in the following table and Figures 5-17 and 5-18.

| Age          | Total Male Pedestrians (2011 – 2015) |            |                 | Total Female Pedestrians (2011 – 2015) |            |                 |
|--------------|--------------------------------------|------------|-----------------|----------------------------------------|------------|-----------------|
|              | All                                  | Serious    | Percent Serious | All                                    | Serious    | Percent Serious |

Figure 6-2

With the highest population, transit usage, VMT, and number of bicyclists, Portland has 64% of the region's Serious Bicyclist crashes (Figure 6-2). Portland also has the highest rate of Serious Bicyclist crashes per capita and per VMT. Multnomah (excludes Portland), Clackamas County and Washington County have lower rates of Serious Bicyclist crashes, which is likely partially due to fewer people cycling.

While Portland has the largest number of Serious Bicyclist crashes, it is apparent from Figure 6-3 that there are a several cities with a relatively high rate of Serious Bicyclist crashes per capita. Troutdale, Milwaukie, and Portland all experienced relatively high rates of Serious Bicyclist crashes between 2011 and 2015.

Figure 6-4

Figure 6-4 presents the annual average number of Serious Bicyclist crashes by month. May through December generally have more Serious Bicyclist crashes, with the peak corresponding to the summer months, likely related to the higher number of people cycling in the warm and dry months.

*By Time of Day*

|                                                                                                              | Sun | Mon | Tue | Wed | Thu | Fri | Sat |  |         | Average Wkday | Average Wkend |
| All Day                                                                                                      | 2.8 | 4.8 | 3.6 | 7.8 | 7.4 | 4.6 | 4.0 |  | All Day | 5.6           | 3.4           |

Figure 6-5 presents the rate of Serious Bicyclist crashes by day of the week and hour of the day using a “heat map” format. Dark cells indicate the highest relative crash time periods; light cells indicate the lowest relative crash time periods. The average weekday and weekend day are summarized on the right side of the figure, while each day is summarized and compared at the bottom of the figure.

The weekday evening peak hours produce the highest number of Serious Bicyclist crashes, mirroring the pattern for all crashes, with the 4:00 – 5:59 pm as the worst. Wednesday and Thursday are the two days with the highest number of Bicyclist crashes, which is consistent with the prior report’s data from 2007 – 2009. No other clear trends are evident.

### By Weather

| 2011-2015 Annual Bicyclist Crashes |                 |
|------------------------------------|-----------------|
| Weather                            | Serious Crashes |
| Cloudy/Clear                       | 30.6            |
| Rain/Fog                           | 3.6             |
| Sleet/Snow                         | 0.0             |
| Unknown                            | 0.8             |
| <b>METRO</b>                       | <b>35.0</b>     |

The majority (88%) of Serious Bicyclist crashes occurred in clear or cloudy conditions (Figure 6-6), as compared to 80% for all crashes (Figure 2-16).

Figure 6-6

### By Road Surface Condition

| 2011-2015 Annual Bicyclist Crashes |                 |
|------------------------------------|-----------------|
| Road Condition                     | Serious Crashes |
| Dry                                | 29.2            |
| Ice/Snow                           | 0.0             |
| Wet                                | 5.4             |
| Unknown                            | 0.4             |
| <b>METRO</b>                       | <b>35.0</b>     |

The majority (84%) of Serious Bicyclist crashes occurred in dry conditions (Figure 6-7), as compared to 73% for all crashes (Figure 2-17).

Figure 6-7

### By Lighting

| 2011-2015 Annual Bicyclist Crashes |                 |
|------------------------------------|-----------------|
| Lighting                           | Serious Crashes |
| Daylight                           | 24.4            |
| Dawn/Dusk                          | 2.8             |
| Night - Dark                       | 1.6             |
| Night - Lit                        | 6.2             |
| Unknown                            | 0.0             |
| <b>METRO</b>                       | <b>35.0</b>     |

The majority (70%) of Serious Bicyclist crashes occurred in daylight (Figure 6-8), as compared to 59% for all crashes (Figure 2-18).

Figure 6-8

## By Roadway Classification

| Roadway Classification | Total Road-Miles | Annual VMT (2015)    | 2011-2015 Annual Bicyclist Crashes |                       |                      |
|------------------------|------------------|----------------------|------------------------------------|-----------------------|----------------------|
|                        |                  |                      | Serious                            | Serious per Road-Mile | Serious per 100M VMT |

\* VMT for local streets is a low-confidence estimate

Figures 6-9 and 6-10

As with all crashes, the region's Serious Bicyclist crashes occur primarily on the arterials, accounting for 65% of these crashes. Figure 6-9 presents the distribution of Serious Bicyclist crashes by roadway classification. As can be seen in Figure 6-10, which presents the rate of Serious Bicyclist crashes per mile of roadway, arterial roadways are more than three times as likely than collectors per mile to be the location of a Serious Bicyclist crash, and more than 40 times as likely than local streets per mile to be the location of a Serious Bicyclist crash.

Figure 6-11

As can be seen in Figure 6-11, when normalized by motor vehicle traffic volume, the Serious Bicyclist crash rate on collectors is higher than on arterials. While the reason for this is not clear from the data, it may be related to a higher use of collector roads by cyclists relative to traffic volume as compared to arterials. Vehicle miles travelled was not available for local streets.

## By Number of Lanes

| Number of Lanes | Total Road-Miles | 2011-2015 Annual Bicyclist Crashes |                       |                      |
|-----------------|------------------|------------------------------------|-----------------------|----------------------|
|                 |                  | Serious                            | Serious per Road-Mile | Serious per 100M VMT |
| 1 – 3 Lanes     | 1,427            | 19.6                               | 0.014                 | 0.66                 |
| 4+ Lanes        | 340              | 15.4                               | 0.045                 | 0.56                 |
| <b>METRO</b>    | <b>1,766</b>     | <b>35.0</b>                        | <b>0.020</b>          | <b>0.61</b>          |

\* Arterial and Collector roadways only

Figure 6-12 and 6-13

The influence of street width is consistent with the influence of roadway classification (Figure 6-12). Wider roadways are the location of a disproportionate number of Serious Bicyclist crashes in relation to their share of the overall system (Figure 6-13), although the effect is not as pronounced as it is for Serious Pedestrian crashes. The Serious Bicyclist crash rate per road mile increases dramatically for roadways with 4 or more lanes. This is a concern, given that in many parts of the region designated bicycling routes often follow arterial roadways with 4 or more lanes.

Figure 6-14

As can be seen in Figure 6-14, when normalized by motor vehicle traffic volume, the Serious Bicyclist crash rate on narrower roads is higher than on wider roads. While the reason for this is not clear from the data, it may be related to a higher use of narrower roads by cyclists relative to traffic volume as compared to multi-lane roadways.

***By Contributing Factor***

| Factor               | 2011-2015 Annual Crashes (Bicyclist) |            |           |            |            |            |           |
|----------------------|--------------------------------------|------------|-----------|------------|------------|------------|-----------|

Figures 6-15 and 6-16

Figure 6-15 and 6-16 present the proportion of Bicyclist crashes by contributing factor for Serious and Fatal crashes, respectively. Alcohol or Drugs and Fail to Yield ROW are the most common factors. The data do not specify whether the driver, the bicyclist, or both were under the influence of alcohol. Other factors, such as Fail to Yield ROW, Excessive Speed, and Aggressive Driving, are for the driver.

The determination of contributing factors is described in more detail in Section 7.

### By Bicyclist's Age and Gender

The age and gender of bicyclists involved in Serious crashes are presented in the following table and Figures 6-17 and 6-18.

| Age          | Total Male Bicyclists (2011 – 2015) |            |                 | Total Female Bicyclists (2011 – 2015) |           |                 |
|--------------|-------------------------------------|------------|-----------------|---------------------------------------|-----------|-----------------|
|              | All Crashes                         | Serious    | Percent Serious | All Crashes                           | Serious   | Percent Serious |
| ≤13          | 98                                  | 5          | 5.1%            | 39                                    | 0         | 0.0%            |
| 14-17        | 131                                 | 1          | 0.8%            | 23                                    | 0         | 0.0%            |
| 18-21        | 164                                 | 28         | 17.1%           | 54                                    | 5         | 9.3%            |
| 22-24        | 236                                 | 11         | 4.7%            | 81                                    | 8         | 9.9%            |
| 25-29        | 223                                 | 19         | 8.5%            | 149                                   | 10        | 6.7%            |
| 30-34        | 262                                 | 17         | 6.5%            | 107                                   | 8         | 7.5%            |

Figures 6-17 and 6-18

## Section 7 – Crash Type Detail

In this section, the four crash types identified in Section 2 as most prevalent are reviewed relative to all crashes in more detail to identify patterns. As documented in Section 2, the most common Serious crash types were Rear End and Turning, while the most common Fatal crash types were Fixed Object and Pedestrian. More detail on Rear End, Turning, Fixed Object, and Pedestrian crashes are presented here.

For each crash type, detailed crash information was summarized for all crashes of that type. The information includes crash severity and contributing factors.

### *Crash Severity*

Every crash is assigned a crash severity based on the most critically injured victim. From worst to best, the classifications are: Fatal, Injury A, Injury B, Injury C, and PDO (property damage only).

**“Serious Crashes”** in this report refers to the total number of Fatal and Injury A crashes.

**“Injury A”** and **“Incapacitating injury”** are used interchangeably. Incapacitating injuries typically are injuries that the victim is not able to walk away from. They are synonymous with the term **“Severe injury”**

**“Injury B”** and **“Moderate injury”** are used interchangeably.

**“Injury C”** and **“Minor injury”** are used interchangeably.

**“PDO”** means property damage only. Crashes must result in \$3,000 or more in damages to be counted.

## Contributing Factors

The State Department of Motor Vehicles assigns causes and errors to participants in each crash, along with identifiers for certain risk factors, including alcohol and drugs. Several causes, errors, and/or events may apply to any single crash. Based on these causes, errors, and risk factors, crashes were evaluated for 14 contributing factors. The first cause, three errors, and one event were reviewed for up to three drivers and one non-motorist per crash, and classified for this analysis as follows:

| Defined Contrib. Factor          | DMV codes included in factor                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Cause Codes         | Error Codes                                                                                 | Event Codes                 |

Figure 7-1 presents the crash severity distribution of all crashes. Figures 7-2 and 7-3 present the proportion of crashes by contributing factor for Serious and Fatal crashes, respectively. Each crash may have several contributing factors.

Figure 7-1

Figures 7-2 and 7-3

Alcohol and Drugs, Aggressive Driving (defined as either Excessive Speed or Following Too Close), Excessive Speed, and Fail to Yield ROW are the most common contributing factors to Serious crashes in the region.

## ***Rear End Crashes***

A Rear End crash results when a vehicle traveling in the same direction or parallel on the same path as another vehicle, collides with the rear end of a second vehicle. In this type, the direction of travel was parallel but continuous.

Rear End is the most common crash type in the region, and although it is rarely Fatal it is often Serious. Rear End crashes constitute 7% of Fatal crashes, 21% of Serious crashes, and 45% of all crashes in the region.

| <b>Factor</b>        | <b>2011-2015 Annual Crashes (Rear-End Crashes)</b> |              |                 |                 |                 |                   |                |

Figure 7-4 presents the crash severity distribution of Rear End crashes. Figures 7-5 and 7-6 present the proportion of crashes by contributing factor for Serious Rear End and Fatal Rear End crashes, respectively. Each crash may have several contributing factors.

Figure 7-4

Figures 7-5 and 7-6

Rear End crashes are less severe than most crashes, producing a high proportion of Injury C and PDO crashes. Aggressive Driving, Fail to Stop, Following too Closely, and Excessive Speed are factors in a substantial proportion of Serious and Fatal Rear End crashes.

## Turning Crashes

A Turning crash results when one or more vehicles in the act of a turning maneuver is involved in a collision with another vehicle. It differs from an Angle crash in that Turning crashes involve vehicles traveling on the same street, whereas Angle crashes involve vehicles traveling on intersecting streets or driveways.

Turning is the second most common crash type in the region, as well as the most common Serious crash type. Turning crashes constitute 10% of Fatal crashes, 24% of Serious crashes, and 22% of all crashes in the region.

| Factor               | 2011-2015 Annual Crashes (Turning Crashes) |            |            |            |              |              |            |

Figure 7-7 presents the crash severity distribution of Turning crashes. Figures 7-8 and 7-9 present the proportion of crashes by contributing factor for Serious Turning and Fatal Turning crashes, respectively. Each crash may have several contributing factors.

Figure 7-7

Figures 7-8 and 7-9

Turning crashes have an average rate of severity compared to other crash types. Fail to Yield ROW, Alcohol or Drugs, and Excessive Speed are often involved in Serious and Fatal Turning crashes.

## ***Fixed Object Crashes***

A Fixed Object crash results when one vehicle strikes a fixed or other object on or off the roadway.

Fixed Object is the second most common Fatal crash type in the region. Fixed Object crashes constitute 26% of Fatal crashes, 17% of Serious crashes, though only 7% of all crashes in the region.

| <b>Factor</b>        | <b>2011-2015 Annual Crashes (Fixed Object Crashes)</b> |              |                 |                 |                 |                   |                |

Figure 7-10 presents the crash severity distribution of Fixed Object crashes. Figures 7-11 and 7-12 present the proportion of crashes by contributing factor for Serious Fixed Object and Fatal Fixed Object crashes, respectively. Each crash may have several contributing factors.

Figure 7-10

Figures 7-11 and 7-12

Fixed Object crashes have a higher rate of severity including fatalities compared to other crash types. Excessive Speed, Aggressive Driving, and Alcohol or Drugs are often involved in Serious and Fatal Fixed Object crashes.

## ***Pedestrian Crashes***

A Pedestrian crash results when the first harmful event is any impact between a motor vehicle in traffic and a pedestrian. It does not include any crash where a pedestrian is injured after the initial vehicle impact.

Pedestrian is the most common Fatal crash type in the region, and the most common crash type to be Fatal. Pedestrian crashes constitute 34% of Fatal crashes, 15% of Serious crashes, though only 2% of all crashes in the region. Pedestrian trips are 10% of all trips in the region.

Figure 7-13 presents the crash severity distribution of Pedestrian crashes. Figures 7-14 and 7-15 present the proportion of crashes by contributing factor for Serious Pedestrian and Fatal Pedestrian crashes, respectively. Further breakdown of the reported error by user follows in Figures 7-16 through 7-19. Each crash may have several contributing factors.

Figure 7-13

Figures 7-14 and 7-15

Pedestrian crashes have the highest severity of any crash type. **A Pedestrian crash is more than 26 times as likely to be fatal than a crash not involving a pedestrian, and more than 110 times as likely to be fatal as a Rear End crash, the most common crash type.** Failure to Yield ROW and Alcohol or Drugs are the most common contributing factors.

Additional analysis was done for this crash type to identify how often the driver was reported to be at fault in Pedestrian crashes and how often the pedestrian was reported to be at fault. For the purposes of this analysis, those causes, errors, and events defined at the beginning of Section 7 are considered errors.

Figures 7-16 and 7-17 present the proportion of Pedestrian crashes by reported error source for Serious Pedestrian and Fatal Pedestrian crashes, respectively.

Figures 7-16 and 7-17

Figures 7-18 and 7-19 present the proportion of crashes by common contributing factor and reported error source for Serious Pedestrian and Fatal Pedestrian crashes, respectively.

Figures 7-18 and 7-19

The Crash Factor Overlaps matrix, Figure 7-20, shows the percentage Serious crashes for different factors.

Crash Factor Overlaps - Percentage of Fatal and Serious Injuries by Row, 2011 to 2015

Figure 7-20 % of all % of left that were...

Guide to reading this chart: Starting with the row names in Column A; Column B represents the % of all crashes pertaining to that row in Column A (eg. 62% of all crashes were on an arterial). The columns following Column B are the % of column A that were also that thing (eg. 18% of arterial crashes [in Column A] were Ped Involved). The columns following Column K [i.e. Ped Involved] are the % of serious crashes that were both that row and column (eg. 55% of serious arterial crashes were at intersections ). For rows 1-7, Columns K onward represent the injury type of the row rather than serious crashes.

| Column A |                      | Col.B       |       |         |       |     |     |     | Col.
